Write a program that provides an HTTP API to store and retrieve files.
It should support the following features:
- Upload a new file
- Retrieve an uploaded file by name
- Delete an uploaded file by name
- include Dockerfile(s) to build docker image(s) to host the API
- Bonus point: if multiple files have similar contents, reuse the contents

How to submit:
1. push the code to public git repository,
2. add README in the top directory of the repository with some instructions for ..
   - how to build / setup the software
   - how to test
